

Z-profile 상관관계: ray 관측 · anchor/dense-init 밀도 · 잘려나간(pruned) Gaussian

① Z 레이어별 '카메라가 한 번도 안 본 비율' — 높을수록 관측 공백

② Z 레이어별 sparse anchor 밀도 — 0이면 그 높이에 당기는 힘이 아예 없음

③ Z 레이어별 depth-mono로 채운 DENSE init 밀도 — sparse anchor의 빈틈을 얼마나 메우는가

④ Z 레이어별 ray-density pruning으로 잘려나간 Gaussian 수 (원시 개수, 8개 run 합산)

⑤ Z 레이어별 prune 비율 (④를 그 구간의 전체 Gaussian 수로 정규화 — 진짜 '이 높이가 위험한가' 지표)

Anchor(점) + dense init(초록 음영) 위치 — 세밀 Z-layer (0.15m/layer) [1/6]
