

Table 1. DRAFT blank template; no measurements. Planned end-to-end quality comparison with $1\times$ input-time allowance. The allowance multiplies the sensor duration and slows input release; it is not faster sensor playback. Tracking and mapping share the hardware and deadline. Input lag remains visible even when mapper optimizer tail is zero.

Dataset	Allowance	Method	PSNR $\uparrow$	SSIM $\uparrow$	LPIPS $\downarrow$	#G (k)	Input lag p95 (s)

^{VI}: RGB+IMU; ^R: RGB only. ^C: conditional monocular+IMU MM3DGS-SLAM adapter, pending verification without sensor depth. — = unmeasured. No cell is a reported result. Valid paired cohort $n/N = \text{---}/\text{---}$ for every dataset and method. Dataset means will give equal weight to scene means; no failed or missing scene has been silently excluded.

Table 2. DRAFT blank template; no measurements. Planned end-to-end quality comparison with $1.5\times$ input-time allowance. The allowance multiplies the sensor duration and slows input release; it is not faster sensor playback. Tracking and mapping share the hardware and deadline. Input lag remains visible even when mapper optimizer tail is zero.
