

Table 1. DRAFT blank template; no measurements. Planned sampling comparison in the original RR versus ERCB replay regime. The three columns preserve the selected mapping-update budgets per keyframe interval. All endpoints must come from paired runs with the same causal input, initialization, loss, topology, and cohort. No historical reported value has been carried into this template.

Metric	Sampling policy	15 updates per interval	30 updates per interval	60 updates per interval
PSNR $\uparrow$	Random reshuffling (RR)	—	—	—
PSNR $\uparrow$	ERCB (original replay)	—	—	—
SSIM $\uparrow$	Random reshuffling (RR)	—	—	—
SSIM $\uparrow$	ERCB (original replay)	—	—	—
LPIPS $\downarrow$	Random reshuffling (RR)	—	—	—
LPIPS $\downarrow$	ERCB (original replay)	—	—	—

— = unmeasured. Original ERCB is not automatically interchangeable with the current cumulative per-view ERVS implementation; newer renderer-budget panels require separate identification.
